Haskell Implementors Workshop

Do it right or stay compatible?

Do it right or stay compatible?

- Badly named function

Do it right or stay compatible?

- Badly named function
- Functions in wrong modules

Do it right or stay compatible?

- Badly named function
- Functions in wrong modules
- Broken class hierarchies

Idea: have a tool that would fix it for us

- due to Thomas Schilling
- inspired by a similar tool for Go

Scenario

- Brent wants to rename `sepBy` to `splitOn`

Scenario

- Brent wants to rename `sepBy` to `splitOn`
- Brent creates a `split.hasfix` file which describes the change

Scenario

- Brent wants to rename `sepBy` to `splitOn`
- Brent creates a `split.hasfix` file which describes the change
- Responsible maintainer
 - Runs `hasfix` on her code

Scenario

- Brent wants to rename `sepBy` to `splitOn`
- Brent creates a `split.hasfix` file which describes the change
- Responsible maintainer
 - Runs `hasfix` on her code
- Irresponsible maintainer
 - `cabal install` runs `hasfix` for the users

- What change kinds should be top-priority to support?
- In what format would they be convenient to express?
- ...

Code (WIP): <https://github.com/feuerbach/hasfix>
